

THE COMPLETE COURSE

Mastering Public Speaking for Online Entrepreneurs

Seven modules that take you from camera-shy to conversion-ready: mindset, message, voice, presence, story, selling — and the 30-day system that makes it stick.

StageMaster

Mastering Public Speaking for Online Entrepreneurs

Welcome — Read This First

You didn't buy this course to become a TED speaker. You bought it because every dollar you make online now runs through your ability to speak: the live streams that grow your community, the webinars that sell your product, the pitch videos that close partners, the daily content that builds your brand.

Here's the uncomfortable truth: the internet has made speaking skills *more* valuable, not less. Anyone can write with AI. Anyone can design with templates. But when you're live on camera, there's nowhere to hide — and that's exactly why the entrepreneurs who can speak well are pulling away from everyone else.

The good news: public speaking is not a talent. It's a stack of learnable skills — mindset, message, voice, body, story, and selling — and this course installs each one in order.

How to use this course:

1. Work through the 7 modules in order. Each takes 30–45 minutes.
2. Complete the workbook exercises for each module before moving on. The exercises ARE the course — reading alone changes nothing.
3. Watch the video lesson for each module as your primer, then read the full module.
4. Start the 30-Day Practice System (Module 7) immediately after Module 1. Don't wait until you "finish learning." You learn speaking by speaking.

One thing that makes this course different: every module installs a named **NLP lever** — a specific Neuro-Linguistic Programming pattern used by elite coaches, negotiators and stage speakers. Reframing. Anchoring. Presupposition. Embedded commands. Analog marking. Nested loops. Submodality shifts. Pace-and-lead. The yes-set. Future pacing. The swish pattern. Identity-level change.

These aren't tricks. They're the mechanics behind why some people are believed and others are ignored. You'll find each one in its module under **The NLP lever**, drilled in the workbook, and summarised on the NLP Patterns cheat sheet.

One ethical line, and it isn't optional: you use these patterns to make true things land — never to make false things sell.

Let's get you stage-ready.

Module 1 — Own the Room in Your Head

The Speaker's Mindset

The lesson in one line: Fear of speaking isn't a character flaw — it's a prediction error your brain makes, and you can retrain it in weeks.

Why your brain panics on camera

When you go live or step up to speak, your brain runs an ancient threat calculation: *many eyes on me + potential judgment = danger to my standing in the tribe*. Your amygdala can't tell the difference between a Zoom webinar and being surrounded by predators. So it floods you with adrenaline: racing heart, shaky voice, blank mind.

Every speaker you admire feels this. The difference is interpretation. Amateurs read the adrenaline as *"I'm terrified, something is wrong."* Professionals read the exact same signal as *"I'm activated, something important is happening."*

This isn't positive thinking — it's physiology. Research on anxiety reappraisal shows that people who relabel nerves as excitement perform measurably better than people who try to "calm down." The arousal is identical; only the story changes.

The three mindset shifts

Shift 1: From performer to giver. Stage fright is self-focus: *How do I look? What if I forget?* The fix is to make the talk about them, not you. Before you speak, write one sentence: "After this, my audience will be able to ____." When your attention is on delivering that outcome, there's no bandwidth left for panic.

Shift 2: From perfect to useful. Your audience doesn't want a flawless speaker — they want a useful one. A stumble followed by a great insight beats polished emptiness every time. Online audiences actually trust visibly human speakers *more*. The occasional "let me say that better" makes you credible, not weak.

Shift 3: From event to rep. Every talk, live, or video is one rep in a long training program — not a verdict on your worth. Bombed a live stream? That's data. High performers keep a "rep log" (you'll build one in the workbook) tracking what worked and what to adjust. The log turns emotional events into engineering problems.

The 5-Minute Pre-Talk Routine

Do this before every live, webinar, or recording:

1. **Physiological sigh (60 seconds).** Double inhale through the nose, long exhale through the mouth. Five rounds. This is the fastest known way to downshift your nervous system.
2. **Power posture (60 seconds).** Stand tall, shoulders back, arms open. Your physiology feeds your psychology.
3. **Outcome sentence (30 seconds).** Say out loud: "After this, they will be able to ____."
4. **First 30 seconds rehearsal (2 minutes).** Say your opening out loud, twice. Nerves are highest in the first half-minute — script and drill only that part.
5. **Relabel (30 seconds).** Say: "I'm not nervous, I'm ready. This energy is fuel."

The NLP lever: The Reframe + The Confidence Anchor

Tool 1 — The Reframe. You don't fight a feeling; you rename it. In NLP, a reframe changes the *meaning* your brain assigns to a signal, and behaviour follows meaning. The adrenaline before you go live has no built-in label — you supply it. Say it out loud, every time: *"This is not nerves. This is readiness."* The words feel silly. The state change is real, and it's immediate.

Tool 2 — The Confidence Anchor. An anchor is a deliberate link between a physical trigger and a peak emotional state, built the same way Pavlov's bell worked. Build yours once:

1. Close your eyes and go back to a moment you were completely on fire — funny, sharp, unstoppable. A conversation, a win, a room you owned.
2. Step into it. See what you saw, hear what you heard. Turn it up: bigger, brighter, louder.
3. At the *peak* of the feeling — not before — squeeze your thumb and middle finger together. Hold three seconds. Release.
4. Break state (look around, shake it out). Then repeat, five times total.

That's a switch. From now on, squeeze those two fingers right before you hit record and your nervous system walks back into that state. This is conditioning, not motivation — it works whether or not you believe in it. Refresh the anchor once a week with a single rep.

Your action steps

- Complete Workbook Exercise 1.1 (Fear Inventory) and 1.2 (Rep Log setup).
 - Build your Confidence Anchor (Exercise 1.4) — five reps, takes three minutes.
 - Do the 5-Minute Pre-Talk Routine before your next recording or live — even a 60-second story post.
 - Start Day 1 of the 30-Day Practice System today.
-

Module 2 — Message Architecture

Structure Any Talk in 15 Minutes

The lesson in one line: Great speakers aren't better improvisers — they're better architects. One clear idea, framed by a hook and a payoff, beats an hour of rambling brilliance.

The One Idea rule

The single biggest mistake online entrepreneurs make: trying to say everything. A talk with five points is a talk with zero points, because your audience remembers almost nothing from live speech — except the ONE thing you built the whole talk around.

Before any live, webinar, or video, complete this sentence: **"If they remember only one sentence, it must be: ____."** That's your Core Idea. Every story, statistic, and slide either serves it or gets cut.

Test your Core Idea: it should be a *claim*, not a topic. "Email marketing" is a topic. "Your email list is the only audience you actually own" is a Core Idea. Claims create tension; topics create naps.

The HPPP Framework: Hook, Point, Proof, Payoff

This four-part skeleton works for a 60-second reel and a 60-minute webinar:

HOOK (first 5–30 seconds). Earn attention before you spend it. Four hook types that work online: - *The stakes hook*: "In the next 10 minutes, you'll learn the pricing mistake costing you 40% of your revenue." - *The story hook*: "Eighteen months ago, my launch made \$0. Last month, the same product did six figures. One thing changed." - *The contrarian hook*: "Everything you've heard about growing on social media is backwards." - *The question hook*: "What would your business look like if every live stream converted at double the rate?"

Never open with "Hey guys, welcome, let me share my screen, can everyone hear me?" You have seconds. Spend them on the hook, handle logistics after.

POINT. State your Core Idea plainly, early, and more than once. Say it, explain it, repeat it in new words. Online audiences join late, get distracted, and multitask — repetition of the core claim isn't lazy, it's design.

PROOF. Support the point with the three P's of evidence: *personal story* (what happened to you), *pattern* (what you've seen across clients/customers/data), and *principle* (why it works). One of each is enough. Ten pieces of proof for one point beats one piece of proof for ten points.

PAYOFF. End with what they can DO. Every talk closes with a clear next action — download this, try this tonight, comment this word, buy this. A talk without a payoff is entertainment. You're not in the entertainment business.

The 15-Minute Talk Builder

For any speaking slot, run this build sequence (full template in the workbook):

1. Write the Core Idea sentence (3 min)
2. Choose your hook type and draft it (4 min)
3. Pick one story, one pattern, one principle as proof (5 min)
4. Write the payoff action (2 min)

5. Say the open and close out loud once (1 min)

That's it. Notes, not scripts, for everything between the open and close — you'll sound alive instead of recited.

The NLP lever: Presupposition + Embedded Commands

Tool 1 — Presupposition. You never argue someone into agreement. You presuppose the agreement and keep talking. A presupposition builds the conclusion into the grammar of the sentence, so the listener has to accept it just to follow along:

- *"When you finish this module..." — not if.*
- *"As you start applying this in your next live..."*
- *"The question isn't whether this works — it's how fast you'll see it."*
- *"Most people notice the difference by their third recording."*

Swap every "if" for a "when" in your talk, and watch how differently it lands.

Tool 2 — Embedded commands. A direct instruction, dropped inside an ordinary sentence, and marked with your voice:

- "You can **download this tonight** and see the difference by the weekend."
- "Some people **register now**; others wait another year."
- "As you **write your Core Idea**, notice how much clearer everything else gets."

The conscious mind hears a normal sentence. The unconscious catches the command. What makes it work is **analog marking** — you drop your pitch slightly and slow down on the command words, so they get flagged as significant. Don't shout it. Mark it.

The ethical line. You mark commands only for actions that genuinely serve the listener. Same pattern, opposite intent, and everyone can eventually feel the difference.

Your action steps

- Complete Workbook Exercise 2.1 (Core Idea drills) and 2.2 (build one real talk with HPPP).
- Complete Exercise 2.3 — rewrite five "if" sentences as presuppositions, and write three embedded commands for your own offer.
- Rewrite the opening of your last video or live using one of the four hook types. Compare.

Module 3 — Voice & Delivery

Sound Like Someone Worth Listening To

The lesson in one line: Your voice has four dials — pace, pause, pitch, and power — and most speakers have never touched any of them.

Why delivery beats content (online especially)

On a stage, the room's energy carries you. On a stream or webinar, your voice does 80% of the work — the audience is one boring minute away from another tab. Monotone is the silent killer of online talks: not because your content is bad, but because unvaried sound tells the listener's brain "nothing new is happening," and their attention obeys.

The fix is not "be more energetic." It's learning to deliberately vary four dials.

Dial 1: Pace

Most nervous speakers rush at 180+ words per minute. The conversational sweet spot is 140–160 wpm, but the skill isn't slowness — it's *variation*. Speed up through familiar setup material; slow way down for the sentence that matters. When you hit your Core Idea, cut your pace in half. The contrast is what signals "this is the important part."

Drill: Read a paragraph of your content three times: once fast, once slow, once mixed. Record and compare. The mixed version wins every time.

Dial 2: Pause

The pause is the most powerful tool in speaking, and the one amateurs fear most. Silence feels like death when you're nervous — but to the listener, a pause before a key line creates anticipation, and a pause after lets it land.

Use the **3-second rule**: after your most important sentence, count three full seconds before speaking again. It will feel like an eternity. It reads as total command.

Pauses also replace filler. You say "um" and "like" because your mouth fears silence while your brain finds the next thought. You don't remove filler by trying not to say it — you replace it with a closed mouth. Pause, breathe, continue.

Dial 3: Pitch

Pitch is your melodic range. Two rules:

1. **End statements down, not up.** Uptalk — ending declarative sentences with a rising tone? — reads as asking permission. Drop your pitch at the end of claims. "This strategy works." (down) is authority. "This strategy works?" (up) is a shrug.
2. **Lift pitch for stories, drop it for conclusions.** Stories get animated, higher, faster. Conclusions get lower, slower, heavier. That contour is what "charisma" mostly is.

Dial 4: Power (projection & breath)

Speaking power comes from breath support, not throat strain. Breathe low into your belly, not high into your chest. Chest breathing is shallow, shaky, and audible; belly breathing gives you steady,

resonant output — and calms your nerves as a side effect.

The 2-minute vocal warmup (before every live/recording): 1. 5 physiological sighs (calm + breath support) 2. Lip trills up and down your range, 30 seconds (loosens everything) 3. “Mmm-ahh” hums, 30 seconds (activates resonance) 4. Say your opening line three ways: quiet, normal, projected — then use the projected version

The NLP lever: Analog Marking + Auditory Pacing

Tool 1 — Analog marking. This is the vocal half of the pattern you met in Module 2. You mark your most important words with a *change in sound* so the listener’s brain flags them as significant. Four ways to mark, and you only need one at a time:

- **Slow down** on the phrase (half your normal pace).
- **Drop your pitch** a notch.
- **Add volume**, slightly.
- **Insert silence** immediately before it.

Mark the Core Idea. Mark the command. Mark the price. Never mark the filler — if everything is marked, nothing is. Most speakers mark nothing, which is exactly why nothing lands.

Tool 2 — Auditory pacing (pace-and-lead with your voice). You don’t open at your peak energy; you open near *theirs*, then lead them up. Someone watching at 11pm on a phone is not at a 9. Meet them at a 5, and take them to an 8 over ninety seconds. That’s why great speakers never feel like they’re shouting at you — they arrive where you are, then move.

Practically: first thirty seconds conversational and close-in. Then build pace, lift energy, and use your marked lines as the steps on the way up.

The 3-second pause is the highest-leverage habit in this module. Land the big point, then stop for three full seconds. It will feel like a year to you. To them it reads as total confidence — and it’s the moment the idea actually gets stored.

Your action steps

- Complete Workbook Exercise 3.1 (four-dial self-audit — record 2 minutes and score yourself).
 - Complete Exercise 3.3 — mark three lines in your next script and record them marked vs unmarked.
 - Do the 2-minute warmup before your next recording. Notice the difference in take one.
 - Pick ONE dial to focus on this week. One dial per week, in order: pause → pace → pitch → power.
-

Module 4 — Camera Presence & Body Language

Command the Frame

The lesson in one line: The camera is not an audience — it's one person, sitting close. Master eye contact with the lens and let your hands talk, and you'll outperform 95% of live streamers.

The one-person principle

The biggest camera mistake: performing to a crowd that isn't there. On the other side of your lens is one person, on their phone, alone. Speak to *one* person — “you,” never “you guys,” never “everyone watching.” The intimacy is the medium's superpower; crowd-speak throws it away.

Eye contact = lens contact

On camera, eye contact means looking at the LENS, not the screen. Looking at your own preview reads as looking down and away — evasive, distracted. Looking at the lens reads as looking directly into the viewer's eyes.

Make it easy: - Put a small sticker arrow next to your lens. - Shrink and drag your preview window directly under the camera. - On webinars, when you deliver key lines and CTAs, look at the lens. You can look at slides or chat between key moments — humans look away while thinking; that's natural. But claims, CTAs, and closes go straight to the lens.

Framing that reads as authority

Five settings that instantly upgrade how you're perceived:

1. **Camera at eye level.** Below eye level = looming nostrils. Above = you look small. Stack books until the lens matches your eyes.
2. **Eyes on the top third line.** Your eyes should sit roughly one-third from the top of frame, with modest headroom.
3. **Arm's length distance.** Close enough for connection, far enough for gestures to be visible.
4. **Light in front, never behind.** A window or lamp facing you beats any ring light behind you. Backlight makes you a silhouette.
5. **Clean, intentional background.** Depth (not a flat wall right behind you) plus 2–3 intentional objects. Nothing moving, nothing cluttered.

Let your hands talk

Gesturing isn't decoration — it measurably increases comprehension and perceived confidence, and it unlocks vocal energy (try sounding flat while gesturing big; you can't).

- **Keep hands visible** in frame at rest and in motion. Hidden hands read as guarded.
- **Gesture inside the “box”** — between shoulders and waist, in front of your torso.
- **Match gesture to content:** enumerate on your fingers (“three things”), show size and contrast with your hands (“the gap between these”), open palms toward the lens when making an offer (openness = trust).
- **Kill self-soothing:** face-touching, pen-clicking, chair-swiveling. Film yourself once and you'll find yours immediately.

Energy calibration

The camera eats about 20% of your energy. What feels slightly over-the-top to you reads as normal-and-engaging on screen; what feels normal to you reads as flat. Before recording, do 10 jumping jacks or a 30-second shakeout. Start at an energy level that feels a notch too high — that's the right level.

The NLP lever: Rapport Building + State Transfer

In person, rapport is built by *pacing* the other person — subtly matching their posture, breathing and tempo until they unconsciously read you as “one of us.” On camera you can't see them, so you can't match them. So you do the next-best thing, and it's more powerful anyway.

You model the state you want them in. Emotional states transfer through a screen. Mirror neurons don't care that it's a recording — whatever you're genuinely feeling starts leaking into the viewer within seconds. Rushed reads as rushed. Anxious reads as untrustworthy. Grounded, warm and slightly leaning in reads as *safe*, and safe is what buys you attention.

Three consequences worth internalising:

1. **The fix for a bad take is never “try harder.”** It's *change your state, then roll again*. Stand up, breathe, squeeze your Module 1 anchor, remember one person you're genuinely helping. Then record.
2. **Warmth beats polish.** A visible, genuine half-smile in the first three seconds outperforms any script.
3. **Decide your state before you decide your words.** Write it at the top of your notes: *calm, warm, certain*. That one line changes the whole take.

Sensory acuity, adapted for online. You can't read faces mid-recording, but you can read the evidence afterwards: retention graphs, where people dropped, which comments came in. Those are your audience's “tells.” Watch your own retention curve once a week and you'll learn more about your delivery than any course can teach you — including this one.

Your action steps

- Complete Workbook Exercise 4.1 (camera setup audit — score your current setup against the five settings).
 - Write your state line (“calm, warm, certain”) at the top of your next script — and run the anchor before you roll.
 - Record 60 seconds to the lens using the one-person principle. Watch it back with sound OFF and audit only your body language.
 - Complete Exercise 4.2 (gesture drill).
-

Module 5 — Storytelling That Sticks

Turn Experience Into Influence

The lesson in one line: Facts inform, stories move. A 90-second story with a point will outsell an hour of features — and you already have every story you need.

Why stories work when facts fail

When you present facts, the listener's brain evaluates: *Is this true? Do I agree?* — a critical, defensive stance. When you tell a story, their brain simulates: they feel what you felt, ride the tension, and want resolution. Persuasion happens in simulation mode, not evaluation mode. This is why every great webinar seller leads with story and why “let me show you the data” rarely closes anyone.

Stories also stick. People forget your framework's steps by tomorrow but retell your story next month — to themselves and, if it's good, to others.

The BAB Story Frame: Before → After → Bridge

The workhorse story structure for entrepreneurs:

- **BEFORE:** The struggle state, with specific, sensory detail. Not “I was struggling with sales” but “I refreshed my Stripe dashboard for the fourth time that morning. Still \$0. Rent was due in nine days.”
- **AFTER:** The transformed state, equally specific. “Last month that same product did \$23,000 while I was at my daughter's swimming gala.”
- **BRIDGE:** What changed — the discovery, decision, or method. This is where your teaching point (or your offer) lives.

Specificity is the whole game. “Nine days,” “fourth time,” “swimming gala” — details are what make a story feel true and land emotionally. Vague stories persuade no one.

The four stories every entrepreneur needs banked

Build these once (workbook), use them for years:

1. **The Founder Story** — why you do this. The moment that made you start. Use it in about-pages, first webinar minutes, podcast intros.
2. **The Discovery Story** — how you found the method you now teach/sell. Naturally sets up your offer as the bridge.
3. **The Customer Story** — a specific person you helped: their before, their after, in *their* details. Social proof in narrative form beats testimonials in bullet form.
4. **The Failure Story** — a face-plant and its lesson. Nothing builds trust faster; it inoculates you against seeming too polished to relate to.

Telling it well: the three amateur mistakes

1. **Starting too early.** Cut the runway. Not “So back in 2019, I had just moved and...” — start inside the tension: “The client email said one word: ‘Refund.’”
2. **No point.** Every story ends by paying off the reason you told it: “And that's when I learned ____.” Story without point is a diary entry.

3. **Over-polish.** Tell it, don't recite it. Know your first line, your last line, and the 3 beats between. The middle stays a little loose — that's what live storytelling should feel like.

The NLP lever: Nested Loops + Submodality Shifts

Tool 1 — Nested loops (open loops). The brain hates an unfinished story. Start one, delay the ending, and attention stays switched on waiting for the close. So: open a loop in your first thirty seconds and don't close it until the end.

"A client of mine once froze on a live webinar. Nine hundred people watching, eleven seconds of dead silence. I'll tell you how that ended — but not yet."

Then teach. Then, at the close, pay it off. **Nesting** is when you open a second loop inside the first, and a third inside that, closing them in reverse order. Two or three loops is the structure behind "I couldn't stop watching." Four is showing off and people get lost.

The rule that keeps you honest: **always close every loop.** An unclosed loop doesn't read as mysterious — it reads as sloppy, and it costs you trust.

Tool 2 — Submodality shifts. Submodalities are the *settings* on a mental image: brightness, size, volume, distance, speed. Change the settings and you change how the memory feels. You can drive those settings from outside, with nothing but word choice — which is exactly what makes the BAB frame so powerful:

- **Narrating the BEFORE**, use small / dark / tight / distant / slow language: *"everything felt narrow, quiet, far away — like it was happening to someone else."*
- **Narrating the AFTER**, go big / bright / loud / close / fast: *"suddenly the room was loud, the screen lit up, it was all right in front of me."*

You're not just telling a story. You're directing their internal cinema. That's the difference between a story people *hear* and a story people *feel* — and only the second one sells.

Your action steps

- Complete Workbook Exercise 5.1: draft all four banked stories in BAB format.
- Complete Exercise 5.2 — write one open loop for your next talk, and its payoff line, before you write anything else.
- Rewrite one BEFORE section and one AFTER section using submodality language.
- Tell one of them in your next piece of content — live, reel, or post.
- Steal-with-pride drill: find one speaker whose stories grip you; note their first sentence technique.

Module 6 — Speaking to Sell

Webinars, Lives & Pitches That Convert

The lesson in one line: Selling from stage isn't a different skill from speaking — it's the same skill pointed at a decision. The close fails in the first ten minutes, not the last five.

The trust ledger

Every minute of a webinar or live either deposits trust (useful teaching, honest stories, proof) or withdraws it (hype, vagueness, premature pitching). You can only withdraw — ask for the sale — if you've deposited enough first. Speakers who "hate selling" usually just pitch from an empty ledger.

The rhythm that works: **teach 70%, story 20%, offer 10%** — and the 10% converts *because* of the 90%.

The Webinar Spine (works for any selling talk, 20–90 min)

1. **Hook + promise (min 0–3).** Stakes hook, then the promise: "By the end, you'll know exactly how to _____, whether or not you ever buy anything from me." That last clause disarms the room and keeps skeptics watching.
2. **Origin story (min 3–8).** Your Discovery Story in BAB format (Module 5). Positions the method — not you — as the hero.
3. **The shift (min 8–15).** Teach the ONE big reframe: why the old way fails, what the new way is. This is your Core Idea. If they only remember this, the talk still converted their thinking.
4. **The framework (middle).** Teach 3 real steps of your method. Teach honestly — give the "what" and "why" completely, let the product be the "done-for-you how." Never teach garbage and hide the good stuff; audiences smell it.
5. **The turn.** One sentence, spoken plainly: "So you can do this yourself with everything I just showed you — or, if you want the shortcut, let me show you what I built." No apology, no speed-up. The turn is where nervous speakers rush; slow down instead.
6. **The offer stack.** Present the product as the bridge to the After state. Name each component + what it does for them (outcome, not feature). Price after value, never before.
7. **Objection pre-emption.** Answer the top three unspoken objections out loud: "You might be thinking _____. Here's the truth..." (time, money, "will it work for me").
8. **Close + urgency + CTA (last 5 min).** One clear action, stated three times, with an honest reason to act now (real bonus, real deadline, real cohort start). Fake scarcity burns the trust ledger to the ground.

The 60-second pitch (DMs, collabs, podcasts, funding)

For short-form selling, use **PSR**: *Problem* ("Most Whop creators get traffic but convert under 2%"), *Solution* ("I built a system that rewrites their checkout flow in an afternoon"), *Result* ("Average lift across 40 stores: 31%. Want me to show you?"). Fifteen seconds each, then stop talking. Amateurs keep pitching after the pitch; pros ask a question and go silent.

Handling the live room

- **Chat is fuel, not the boss.** Acknowledge names and reactions at planned moments (“drop a if this is landing”) — but never let chat derail the spine.
- **Questions:** repeat the question, answer briefly, bridge back: “Great question — and it connects to step two...”
- **Hecklers/skeptics:** agree with the valid kernel, answer once, move on. Never debate one viewer at the expense of a hundred.
- **Tech failures:** narrate calmly and keep going. How you handle a glitch IS a trust deposit. Panic is the only real failure.

The NLP lever: Pace-and-Lead + The Yes-Set + Future Pacing

These are the three most useful persuasion patterns in NLP, and they run in this order. Get the order wrong and none of them work.

Tool 1 — Pace and lead. You *pace* by describing what is already true in their world, until they’re silently agreeing. Only then do you *lead*.

“You’ve bought the courses. You’ve posted consistently. And it still feels like shouting into a void.” (*pace, pace, pace*) “Here’s what actually changes that.” (*lead*)

Three paces, then lead. Cold pitches bounce for exactly one reason: they lead before they pace.

Tool 2 — The yes-set. Agreement is momentum. Stack three small, obviously-true agreements before the big ask, and the big ask inherits the momentum:

“You want more clients, right? You’d rather they came to you than you chasing them? And you’d rather not spend your whole day on social media?”

Yes. Yes. Yes. Then the offer. Keep every question genuinely true for them — a yes-set built on manipulative questions collapses the moment they notice.

Tool 3 — Future pacing. Before you ever name a price, walk them through *already owning the result*. You’re letting them try it on:

“Picture yourself thirty days from now. You open your laptop, you hit record, and there’s no knot in your stomach. You just... speak. What’s that worth to your business?”

People buy the picture long before they buy the product. Future pacing also does the work *after* the sale: a buyer who has vividly imagined using it is far more likely to actually open it — which is why this one line reduces refunds.

Where they sit on the Spine: pace-and-lead in beats 1–3, the yes-set just before the turn (beat 5), future pacing at the top of the offer stack (beat 6), and one more future pace in your close.

Your action steps

- Complete Workbook Exercise 6.1: map your current (or first) offer onto the Webinar Spine.
- Complete Exercise 6.3 — write your three pacing statements, your three yes-set questions, and your future-pace paragraph word-for-word.
- Write your Turn sentence and your three objection pre-emptions word-for-word. These few sentences are the only parts worth scripting fully.

- Draft your PSR 60-second pitch and drill it out loud ten times.
-

Module 7 — The 30-Day Practice System

From Knowing to Owning

The lesson in one line: You don't rise to the level of what you know — you fall to the level of what you've drilled. Thirty days of small daily reps beats a year of occasional big pushes.

Why a system beats motivation

Speaking is a motor skill, like a golf swing. Reading about golf swings doesn't lower your handicap; reps do. The system below takes 10–20 minutes a day and is built on three rules:

1. **Daily beats big.** Ten minutes every day rewires faster than two hours on Sunday.
2. **Record everything.** The camera is your coach. You cannot fix what you haven't watched.
3. **One focus per rep.** Each drill targets ONE skill (pause, hook, eye contact). Trying to fix everything at once fixes nothing.

The 30-day plan

Week 1 — Foundation (Modules 1–2). Daily: 5-Minute Pre-Talk Routine + record a 60-second answer to a simple prompt ("What do you sell and why does it matter?"). Watch each one back. Log one win, one fix in your Rep Log. - Day 3: Write your Core Idea sentence for your business. - Day 5: Build one full HPPP talk with the 15-Minute Builder. - Day 7: Record that talk, 3–5 minutes, one take. This is your baseline video — you'll compare against it on Day 30.

Week 2 — Voice (Module 3). Daily: 2-minute vocal warmup + record 90 seconds focusing on ONE dial (Days 8–9 pause, 10–11 pace, 12–13 pitch, Day 14 power). Watch back with eyes closed — audio only.

Week 3 — Camera & Story (Modules 4–5). Daily: 90 seconds to the lens, one-person principle. - Days 15–17: body language focus — watch back with sound OFF. - Days 18–21: tell one banked story per day in BAB format. By Day 21, all four stories are drilled.

Week 4 — Selling & Integration (Module 6). - Days 22–24: drill your PSR pitch and your Turn sentence daily. - Days 25–27: record a 10-minute mini-webinar following the Spine. - Days 28–29: go LIVE (any platform, any audience size — even 0 viewers counts; the rep is the point). - Day 30: re-record your Day 7 baseline talk. Watch both. Welcome to the top 5%.

The Rep Log (your permanent practice tool)

After every rep, one line: date, drill, one thing that worked, one thing to fix next time. That's it. The log does two jobs: it converts cringe into data, and after 30 days it becomes undeniable proof of progress — which permanently changes your identity from "someone who hates speaking" to "someone who trains speaking."

After Day 30

- Keep a **2x/week maintenance rhythm**: one recorded rep, one live rep.
- Book real stakes: pitch a podcast guest spot, host a monthly live, run your first (or next) webinar. Skills grow at the edge of comfort.
- Re-run the full 30 days before any high-stakes season (launch, fundraiser, conference).

The NLP lever: The Swish Pattern + Identity-Level Change

Tool 1 — The Swish Pattern. This is the NLP technique for killing an avoidance reflex — the flinch that makes you find something else to do instead of recording. It takes ninety seconds:

1. Picture the image that triggers the avoidance: you freezing on camera, the comment you're dreading, the blank stare. See it clearly.
2. In the bottom corner of that picture, place a small, bright image of the speaker you're becoming — relaxed, sharp, in flow.
3. Count: one, two, **three** — and the small bright image explodes forward, filling your whole view and blasting the old one out of existence.
4. Break state completely. Blank screen. Look around the room.
5. Repeat five times, faster each time.

You're training your brain to jump straight from the trigger to the new picture. Do it every morning for the first week of the thirty days and the flinch loses its grip. If it comes back before a big live, run five reps in the ninety seconds before you go on.

Tool 2 — Identity-level change. This is the one that makes the other thirty-odd tools stick. In NLP, behaviour sits underneath identity — change identity and behaviour follows without willpower.

So change the sentence:

- "I'm working on my public speaking."
- "I'm a speaker who's getting sharper."

Sounds like semantics. It isn't. "Working on it" is a project, and projects get deprioritised the week you don't feel like it. "I'm a speaker" is who you are, and people don't negotiate with who they are. Say the second version out loud, in your Rep Log, and to other people. Thirty days of reps plus that one sentence is how this becomes permanent instead of a course you once bought.

Your action steps

- Print the 30-Day Tracker (cheat sheet #5) and put it somewhere you'll see daily.
 - Run five Swish reps now, then every morning of Week 1.
 - Write your identity sentence at the top of your Rep Log.
 - Do Day 1 today. Not Monday. Today.
-

You're Ready

Seven modules, one truth: speaking is the highest-leverage skill in your business, and it's trainable. Every live you host, every webinar you run, every video you post is now an asset — because you know how to build the message, deliver it with presence, and turn attention into revenue.

The camera light is on. Own it.
